Category:	Drivers - Storage	Estimated time:	0.00 hour
Target version:		Pull request:	
Resolution:	invalid		
Description			
<p>Hello, curently I pending new storage driver based for OpenNebula, and I need custom deploy script.</p> <p>I created custom script: "deploy.my_tm" similarly on ceph custom scripts: "save.ceph" and "restore.ceph", in /var/lib/one/remotes/vmm/kvm/, but it does not work.</p> <p>I think we need to do this feature working globally for all scripts, not only for save and restore.</p>

This should not be considered a new feature. For your reference here's the vmm driver guide:

http://docs.opennebula.org/5.2/integration/infrastructure_integration/devel-vmm.html that may help you to change the driver to your needs...

Hello,

I already read this guide before, but I still not understand why not?

It does not break anything, but may be very useful for custom storage drivers.

What if I don't want to do any changes in the default vmm deploy script?

I just want to provide custom functions only for my transport driver.

Especially since it is already done for save.ceph and restore.ceph. Why not implement this function for all other scripts?
