Target version:	Release 5.6	Pull request:	
Resolution:			
Affected Versions:	Development		

Description

There is a problem regarding vcenter and the imported resources:

When u import a resource a hash process start to give unique name to the one object,

The hash process has input values like vsphere location,

This location is not properly defined due vsphere API problems, we are always catching same cluster location, so its possible to create collissions easily.
